

Ground Truth

Time

Q: Describe any pulmonary diseases and disorders in relation to prior study.

A: The right pleural effusion has increased.

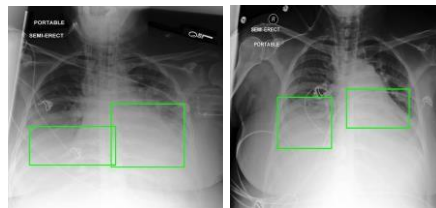

The left lower lobe consolidation or collapse persists.

ChexAgent

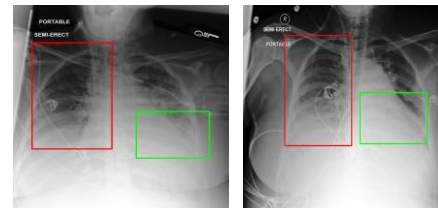

In the Image, there is evidence of volume loss in the left lower lobe better new compared to prior. Cardiomegaly has resolved.

Qwen3-VL-8B

The current image shows improved bilateral pulmonary opacities, with decreased density and extent of lower-lung infiltrates.

Ours

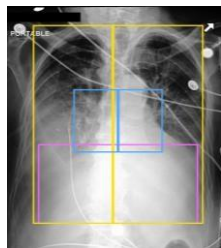

Left lower lobe collapse is unchanged.

The right pleural effusion has worsened.

There is indication of vascular congestion.

Ground Truth

Q: Describe any abnormal findings.

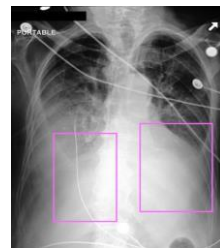

A: There are large right and moderate left pleural effusions and severe bibasilar atelectasis. There is mild pulmonary edema.

Libra-ft

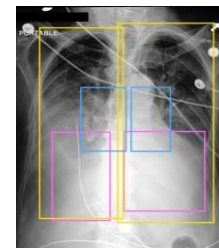

There are large bilateral pleural effusions with right upper lobe atelectasis. There is an opacity over the right mid to lower lung. Cardiac silhouette is obscured.

MedVersa

The bibasilar opacities are most consistent with pneumonia.

Ours

There are bilateral pleural effusions, larger on the right than on the left.

There is mild pulmonary edema.

There is severe bibasilar atelectasis. Cardiac silhouette is obscured.
